

Logical Database Design

Dr. John Artz

Overview

- Relational Table Design is Based on Functional Dependency
- 1st NF: All Data Items Must Be Atomic Facts
- 2nd NF: Full Functional Dependencies
- 3rd NF: No Transitive Dependencies
- Normalization Leads to Smaller Tables
- Joins Allow Us to Put Them Back Together Again

Three Level Database Design

What Kinds of Things Do We Have or Need Data About?

Conceptual Design

Categories

Next Week's Focus

How Do We Map Those Things Into Logical Tables?

Logical Design

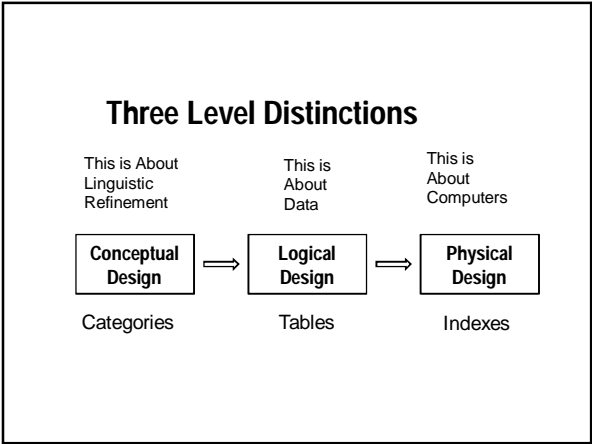

Tables

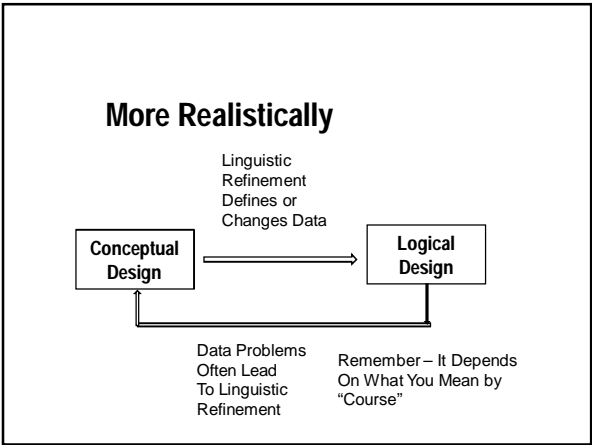

Today's Focus

How Do We Store It On a Computer? (Beyond the Scope of Our Interest)

Physical Design

Indexes

Recall: What Do You Mean By Course?

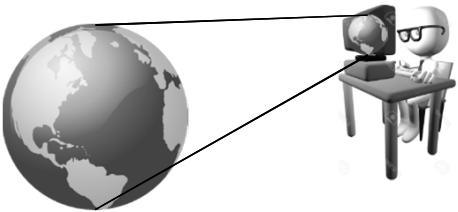

Course	Section	Description	Day	Time
ISTM6202	10	Database	F	4-6
ISTM6202	11	Database	M	6-8
ISTM6202	12	Database	R	6-8
ISTM6203	10	Telecom	W	6-8
ISTM6203	11	Telecom	M	8-10
ISTM6204	10	Proj. Mgmt	R	8-10
ISTM6207	10	IRM	T	6-8

How Many Courses
Are Offered?

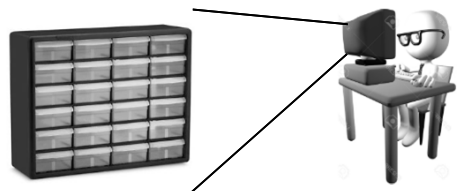

The Answer Could
Be 4 or 7 Depending
On What You Mean
By “Course”

Is There Some Way
To Catch This?

First and Foremost: A Database is a Model

Otherwise, It Is Just Storage

Storage Isn't a Bad Thing

- Web Applications
- Documents
- Images
- Videos
- Big Data

All Need Storage

But, If Your Goal is Information,
Storage Alone Isn't Enough

Second, It Must Be Designed Correctly

Otherwise, It Is Just Junk

Wait, a Minute!

Database Design Prevents Junk

This, too, Should be *Designed*
To Provide What You Need

Storage vs. Information Databases

Storage Databases
Provide

Storage

Designed Databases
Provide

Information

Storage Databases

These Are Referred to as NoSQL Databases

Storage Database Applications

Web Applications

INTERNET of THINGS

BIG DATA

Hold on!

Are You Saying That NoSQL Databases Are Just Junk

No, I'm Saying that the Raw Data from NoSQL Databases is Just Junk

An Analogy for Big Data

Gold Mining Produces Gold Dust

It Takes Design And a Production Process to Produce Jewelry

The Challenge is Turning Gold Dust into Jewelry
The Same is True With Big Data

Actually, It's a Spectrum

This Raises a Question

How Do You
"Design" a
Database?

The Answer is Normalization

- There Are Rules to Follow Called Normalization
- However, the Rules are Not Enough Without a Deeper Understanding
- So, We Will Sneak Up on It By Providing an Understanding of Foundation Concepts:
 - What is Data?
 - What is an Entity?

We Call These Things Entities

- An entity is something that exists as itself, as a subject or as an object, actually or potentially, concretely or abstractly, physically or not. It need not be of material existence. In particular, abstractions and legal fictions are usually regarded as entities. – Wikipedia
- OK, Let's Parse This

Parsing Entity Definition

- An Entity is a "Thing"
- It Exists As Itself (Day vs. Night, War vs. Peace)
- Subject (Acted Upon) or Object (Actor)
- Actually (Now) or Potentially (In the Future)
- Concrete (e.g. Person) or Abstract (e.g. Teenager)
- Physical (e.g. Product) or Not (e.g. Service)

Thing vs Entity

- Every Entity is a "Thing"
- But, Not Every "Thing" is an Entity

Examples of Entities

These Are All Entities, In Case You Get
Confused As We Tease Out Some Subtleties

What Are Some Non Entities

- Air, Water, Outer Space, The Universe
- Love, Justice, Kindness, Well Being
- Evolution, Philosophy, Literature
- Ambition, Motivation, Revenge
- Good, Bad, Right, Wrong, Eternity
- Gravity, Dark Matter, Time, Space

Entities vs. Non Entities

- Some Non Entities Can Become Entities By Redefining Them More Rigorously
- Some Entities Can Become Non Entities Due to Fuzzy Definitions or Sloppy Conversational Usage
- Is Your "Friend" an Entity
- I Was Talking to My "Friend" the Other Day....

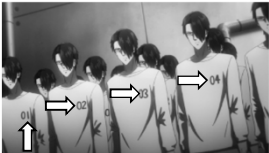

Non Entity – Not Unique

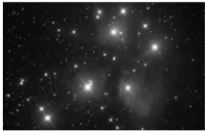

Human Clones

These Are Non Entities Because They Are Not Uniquely Identifiable

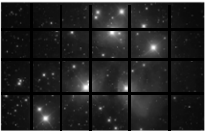

These Are Entities. They are Uniquely Identifiable

Non Entity – Not Distinguishable

The Night Sky is Not an Entity Although It Is a Thing

Cells Could Be Entities Or the Stars Could Be As Well

It's a Spectrum Here Too

Poorly Defined Entity Leads to Poor Quality Information

Well Defined Entity Leads to Solid Information

Entities Have Facts About Them

Name
Birth Date
Height
Weight
Hair Color
Eye Color
Cell Phone
Email Addr

What Are Facts?

- Facts Are Verifiable Pieces of Data About an Entity that Can Be Used in Identification, Elaboration, or Summary Regarding the Entity

Fact vs. Opinions

Facts	Opinions
Name	Cute
Birth Date	Smart
Height	Smells Nice
Weight	Friendly
Hair Color	Too Loud

What is Data?

- Data Is a Set of Values of Qualitative or Quantitative Variables
- Data is Information or Knowledge Represented or Coded in Some Form Suitable for Better Usage or Processing
- A Data Item is a Single Atomic Piece of Data
- Data Items Are Facts About Entities

What is Not Data?

- Images
- Documents
- Spreadsheets
- Newspaper Stories
- Gossip
- Online Reviews

What Is a Database?

- A Database Is An Organized Collection Of Data
 - Wikipedia
- Notes
 - Organization Implies Purpose
 - Collection Implies Containment
 - Data Implies Discreet Pieces of Information

What Is a Relational Database?

- A relational database is a digital database whose organization is based on the relational model of data, as proposed by E.F. Codd in 1970. This model organizes data into one or more tables (or "relations") of rows and columns, with a unique key for each row.
 - Wikipedia

Relational vs. Not Relational

Relational

Not Relational

```
<Soup>
<Id>1</Id>
<Type>Chicken Noodle</Type>
<Vendor>Progresso</Vendor>
  <Mode>Canned</Mode>
<Vendor>Campbells</Vendor>
  <Mode>Canned</Mode>
<Vendor>Lipton</Vendor>
  <Mode>Dried</Mode>
</Soup>
```

A Relational Table

Table Name

Primary Key

Attributes Or Columns

Instance Row or Tuple

SoupID	Type	Vendor	Mode	Style
1	Chicken Noodle	Progresso	Canned	Basic
2	Chicken Noodle	Campbells	Canned	Basic
3	Chicken Noodle	Lipton	Dry	Basic
4	Chicken Noodle	Campbells	Canned	Chunky
5	Chicken Noodle	Wolfgang Puck	Canned	Gourmet
6	Chicken Noodle	Pacific Organic	Boxed	Organic
7	Minneestrona	Progresso	Canned	Basic
8	Minneestrona	Campbells	Canned	Basic
9	Minneestrona	Amy's Organic	Canned	Organic

Relational Rules

- One Kind of Entity Per Table (Entity Integrity)
- Entities Must Be Uniquely Identifiable
- Facts Must Be Atomic

One "Kind" of Entity per Table

☒

People

☐

Stuff

Entity Integrity

- In the Relational Model We Refer to this as Entity Integrity
- This is the Single Most Important Principle in Relational Database Design
- Notice the Slick Linguistic Slight of Hand With "One Kind of Entity"

Uniquely Identifiable Entities

People

Clones

Atomic Values

People
Adams
Markov
Watson

NonAtomic

A Few Intuitive Observations

- Table Name Must Describe a Homogenous Group of Entities
- Rows Must Be Instances of Those Entities
- Instances Must Have Unique Identifiers
- All Instances Must Have the Same Attributes
- Attributes Must Be Single Valued Facts

Functional Dependency

- Relational Database Design is Based on a Relationship Between Data Items (Facts) Called Functional Dependency
- Intuitively, Y is Functionally Dependent on X, If a Given Value of X Determines a Unique Value for Y
- Notationally:
 - $X \rightarrow Y$ (read X determines Y)

Understanding Functional Dependency

- If I Give You a Name, Can You Give Me a Unique Cell Phone Number?
- If I Give You a Cell Phone Number, Can You Give Me a Unique Name?
- If I Give You an Email Address Can You Give Me a Unique Name

Functional Dependency Exercise

- What Does a GWID Determine?
- What Determines a GWID?
- What Does a City Name Determine?
- What Determines a City Name?

Intuitive Table Design

Primary Key Determined Facts

SoupId	Type	Vendor	Code	Style
1	Chicken Noodle	Progresso	Canned	Basic
2	Chicken Noodle	Campbells	Canned	Basic
6	Chicken Noodle	Lipton	Dry	Basic
7	Chicken Noodle	Campbells	Canned	Chunky
8	Chicken Noodle	Wolfgang Puck	Canned	Gourmet
9	Chicken Noodle	Pacific Organic	Boxed	Organic
10	Minnestrone	Progresso	Canned	Basic
11	Minnestrone	Campbells	Canned	Basic
12	Minnestrone	Amy's Organic	Canned	Organic

Intuitively, A Relational Table has a Determinant Which We Call the Primary Key, Followed By the Facts it Determines

MultiAttribute Dependency

- If $X \rightarrow Y$, X may be a Set of Data Items
- For Example, This Class is Determined Uniquely By: Year, Semester, Course, Section
- 2016, Fall, ISTM6200,10 \rightarrow Duques 351, 28, Artz

Subset Determinants

- 2016, Fall, ISTM6200,10 → Duques 351, 28, Artz

Subset Determinants Should
Not Be in the Same Table

Full Functional Dependency

- An Attribute Y may be Determined by a Set of Attributes A,B,C ($ABC \rightarrow Y$)
- If X is a Set of Attributes Such That $X \rightarrow Y$ and there is no Subset Z of X so that $Z \rightarrow Y$ Then Y is Fully Functionally Dependent on X

Full FD Example

- 2016, Fall, ISTM6200,10 → Python, 28
- A Functional Dependency Exists:
 - 2016, Fall, ISTM6200,10 → Python
- But, It is Not a Full Functional Dependency As:
 - ISTM6200 → Python
- Course Name Is Determined By a Subset

Transitive Determinants

- 2016, Fall, ISTM6200,10 → Duques 351, 28, Artz
-
- ```

graph TD
 A["2016, Fall, ISTM6200,10"] --> B["ISTM Dept"]
 B --> C["Dept Chair"]
 D["Duques 351, 28, Artz"] --> E["Capacity"]
 D --> F["Email"]

```

Subset Determinants Should  
Not Be in the Same Table

### Transitive Dependency

- Let X, Y, and Z be Attributes such that  
 $X \rightarrow Y$  and  
 $Y \rightarrow Z$
- Then a Transitive Dependency Exists Between X and Z such that  
 $X \rightarrow Z$

### Normalization

- Normalization Helps Us Achieve Atomicity
- 1<sup>st</sup> Addresses Attribute Atomicity
- 2<sup>nd</sup> and 3<sup>rd</sup> Normal Forms Addresses Entity Kind Atomicity

### Higher Normal Forms

- 4<sup>th</sup> Normal Form Addresses Multivalued Dependencies
- 5<sup>th</sup> Normal Form Addresses Lossless Joins
- Boyce-Codd Normal Form Defines Normalization in Terms of Alternative Keys
- These Are Beyond the Scope of this Introduction

---

---

---

---

---

---

---

### 1<sup>st</sup> Normal Form

All Fields Must Be Atomic

|                                                                                     |                |           |            |                                                                                                  |
|-------------------------------------------------------------------------------------|----------------|-----------|------------|--------------------------------------------------------------------------------------------------|
|  | Chicken Noodle | Split Pea | Minestrone | <br>132458664 |
|-------------------------------------------------------------------------------------|----------------|-----------|------------|--------------------------------------------------------------------------------------------------|

No Blobs

No Repeating Groups

No Composite Fields

---

---

---

---

---

---

---

### Non Atomic Key Problem

| Date         | Leap Year | Day of Week | Season | Weekend |
|--------------|-----------|-------------|--------|---------|
| Apr 06 2016  | Y         | Weds        | Spring | N       |
| May 8 2017   | N         | Mon         | Spring | N       |
| July 15 2017 | N         | Sat         | Summer | Y       |

---

---

---

---

---

---

---

Non Atomic Value Problem

| CRN   | Description | Course   |
|-------|-------------|----------|
| 13311 | Database    | ISTM6202 |
| 15166 | Python      | ISTM6290 |

What Department is Responsible  
For the Python Course?  
How Many Courses Does That  
Department Offer?

---

---

Structured Numbers

| Work Order Charges |            |             |        |      |
|--------------------|------------|-------------|--------|------|
| Account            | Date       | Charger     | Amount | Code |
| 195-2436-023       | 02/06/2015 | Jones, Fred | \$394  | 2A7  |

↑  
Account is a Structured  
Number Consisting Of a  
Project Id, Task Id and  
Work Order Number

↑  
Code Consists of a  
Category, Level of  
Importance and a  
Labor Level

Why Is This a Problem?

---

---

---

---

---

---

---

Repeating Groups

| Account Charge |    |    |    |    |    |    |    |    |    |    |    |
|----------------|----|----|----|----|----|----|----|----|----|----|----|
| Account        | 1  | 2  | 3  | 4  | 5  | 6  | 7  | 8  | 9  | 10 | 11 |
| 195-2436-023   | 23 | 17 | 19 | 26 | 26 | 24 | 33 | 22 | 19 | 17 | 22 |

This Table Maintains the Account  
Charges for the Past Twelve Months

Why Is This a Problem?

---

---

---

---

---

---

---

### Non Text Attributes

| Employees       |             |                                                                                   |
|-----------------|-------------|-----------------------------------------------------------------------------------|
| Employee Number | Name        | Picture Id                                                                        |
| 000000001       | Gates, Bill |  |

↑

This Table Has a Non Text Attribute

Why Is This a Problem?

---

---

---

---

---

---

---

---

### Violations of First Normal Form

- All Violations of 1NF Must Be Removed in Order for a Table to Be in 1NF
- And a Table Must Be in 1NF Before Proceeding to Higher Normal Forms

---

---

---

---

---

---

---

---

### 2<sup>nd</sup> Normal Form

- All Non Key Attributes Must Be Dependent on the Whole Key

| Soup Sales |          |         |          |        |           |        |
|------------|----------|---------|----------|--------|-----------|--------|
| Promo Id   | Store Id | Soup Id | Store Id | Day Id | Soup Type | Sales  |
| 8          | 5        | 3       | 4        | 17     | Split Pea | 432.25 |

↑                      ↑

Soup Type is a Fact About The Soup Not the Sale

---

---

---

---

---

---

---

---

### 2<sup>nd</sup> Normal Form Solution

| Soup Sales |          |         |          |        |        |
|------------|----------|---------|----------|--------|--------|
| Promo Id   | Store Id | Soup Id | Store Id | Day Id | Sales  |
| 8          | 5        | 3       | 4        | 17     | 432.25 |

| Soups   |           |
|---------|-----------|
| Soup Id | Soup Type |
| 3       | Split Pea |

We Decompose the Larger Table into Smaller Atomic Tables

---

---

---

---

---

---

---

---

### 3<sup>rd</sup> Normal Form

- No Transitive Dependencies

| StoreId | Location     | elevati | size   | mgrname       | grade    | years |
|---------|--------------|---------|--------|---------------|----------|-------|
| 1       | Rockville    | Basic   | Medium | Smith, J.     | Junior   | 5     |
| 2       | Potomac      | Upscale | Medium | Williams, K.  | Midlevel | 8     |
| 3       | Gaithersburg | Basic   | Large  | Costenably    | Junior   | 6     |

Manager Grade and Years Are Facts About The Manager, Not About the Store

---

---

---

---

---

---

---

---

### 3<sup>rd</sup> Normal Form Solution

| StoreId | Location     | Elevation | Size   | MgrId |
|---------|--------------|-----------|--------|-------|
| 1       | Rockville    | Basic     | Medium | 1     |
| 2       | Potomac      | Upscale   | Medium | 2     |
| 3       | Gaithersburg | Basic     | Large  | 3     |
| 4       | Bethesda     | Upscale   | Medium | 4     |
| 5       | Frederick    | Basic     | Large  | 5     |

Facts About the Store

| MgrId | MgrName       | Grade    | Years |
|-------|---------------|----------|-------|
| 1     | Smith, J.     | Junior   | 5     |
| 2     | Williams, K.  | Midlevel | 8     |
| 3     | Costenably    | Junior   | 6     |
| 4     | Albertson, M. | Senior   | 15    |
| 5     | Gershman, L.  | Midlevel | 9     |

Facts About the Manager

We Decompose the Larger Table into Smaller Atomic Tables

---

---

---

---

---

---

---

---

Normalization

- The Process of Logically Designing Tables in a Relational Database is Called Normalization
- We Will Get to That in Week 12
- For Now, We Can Simply Say That Normalization Tends to Break Larger Tables into Smaller Ones

---

---

---

---

---

---

---

---

An Un-normalized Table

Day of Sale Info      Store Info      Promo Info

| Day | Day of Sale | Store  | Manager   | Grade  | Years | Location  | Size   | Elevation | Type          | Vendor         | Model      | State   | Brand | Target        |

### The Problem With Normalizing

| StoreId | Location    | Size    | Elevation | MgrID |
|---------|-------------|---------|-----------|-------|
| 1       | Rockville   | Basic   | Medium    | 1     |
| 2       | Potomac     | Upscale | Medium    | 2     |
| 3       | Gathersburg | Basic   | Large     | 3     |
| 4       | Bethesda    | Upscale | Medium    | 4     |
| 5       | Frederick   | Basic   | Large     | 5     |

| MgrId | MgrName       | Grade    | Years |
|-------|---------------|----------|-------|
| 1     | Smith, J.     | Junior   | 5     |
| 2     | Williams, K.  | Midlevel | 8     |
| 3     | Costenably    | Junior   | 6     |
| 4     | Albertson, M. | Senior   | 15    |
| 5     | Gershman, L.  | Midlevel | 9     |

What If We Wanted Information About a Store Including the Manager's Name?

| TrxId | DoY | StoreId | SoupId | Promold | Sales  |
|-------|-----|---------|--------|---------|--------|
| 1     | 1   | 1       | 1      | 1       | 405.18 |
| 2     | 1   | 1       | 2      | 1       | 453.3  |
| 3     | 1   | 1       | 3      | 1       | 868.81 |
| 4     | 1   | 1       | 4      | 1       | 425.61 |
| 5     | 1   | 1       | 5      | 1       | 267.48 |
| 6     | 1   | 1       | 6      | 1       | 719.81 |

Or Information About a Sale With Attributes We Recognize?

---

---

---

---

---

---

---

---

### Joining Tables

- Joining Tables Allows Us To Denormalize Tables on the Fly By Matching Foreign Keys With The Corresponding Primary Keys In Other Tables
- In Order To Do This We Must Specify The Tables Involved and the Columns With Matching Values

---

---

---

---

---

---

---

---

### Without Joins

Select SoupId, Sales from Sales  
Where Sales > 1999.50;

We Get →

| Soup Id | Sales   |
|---------|---------|
| 10      | 1999.53 |
| 11      | 1999.73 |
| 15      | 1999.96 |

But, Which Soups Are They?

The Soup Name is In the Soups Table

---

---

---

---

---

---

---

---

With a Join

Select Type, Sales  
from Sales, Soups  
Where Soups.SoupId = Sales.SoupId   ←This Is  
And Sales > 1999.50;                    The Join  
Criteria

Now We Get →

| Type         | Sales   |
|--------------|---------|
| Split Pea    | 1999.53 |
| Clam Chowder | 1999.73 |
| Minestrone   | 1999.96 |

---

---

---

---

---

---

---

Multiple Table Joins

If We Want to Turn All of These Key  
Values Into Recognizable Values,  
We Will Have to Join Multiple Tables

| Trxid | DoY | StoreId | SoupId | PromId | Sales  |
|-------|-----|---------|--------|--------|--------|
| 1     | 1   | 1       | 1      | 1      | 405.18 |
| 2     | 1   | 1       | 2      | 1      | 453.3  |
| 3     | 1   | 1       | 3      | 1      | 868.61 |
| 4     | 1   | 1       | 4      | 1      | 425.61 |
| 5     | 1   | 1       | 5      | 1      | 267.48 |

---

---

---

---

---

---

---

Multiple Table Example

Select DoW, Medium, Location, MgrName, Type, Sales  
from Days, Promotions, Stores, Managers, Soups, Sales  
Where Days.DoY = Sales.DoY  
And Promotions.PromId = Sales.PromId  
And Stores.StoreId = Sales.StoreId  
And Managers.MgrId = Stores.MgrId  
And Soups.SoupId = Sales.SoupId  
And Sales > 1999.50;

---

---

---

---

---

---

---

Ta Da !!

| DoW  | Medium  | Location     | MgrName      | Type         | Sales   |
|------|---------|--------------|--------------|--------------|---------|
| Fri  | Newsppr | Galthersburg | Costenably   | Split Pea    | 1999.53 |
| Fri  | Radio   | Frederick    | Gershman, L. | Clam Chowder | 1999.73 |
| Tues | Instore | Potomac      | Williams, K. | Minnestrone  | 1999.96 |

---

---

---

---

---

---

---

Renaming Tables

Select DoW, Medium, Location, MgrName, Type, Sales  
from Days D, Promotions P, Stores St, Managers M,  
Soups So, Sales Sa  
Where D.DoY = Sa.DoY  
And P.Promold = Sa.Promold  
And St.Storeld = Sa.Storeld  
And M.Mgrld = St.Mgrld  
And So.SoupId = Sa.SoupId  
And Sales > 1999.50;

---

---

---

---

---

---

---

Multi-Table Selection Criteria

Select DoW, Type, Sales  
from Days, Promotions, Soups, Sales  
Where Days.DoY = Sales.DoY  
And Promotions.Promold = Sales.Promold  
And Soups.SoupId = Sales.SoupId  
And Soups.Type = "Chicken Noodle"  
And Days.Weather = "Clear"  
And Promotions.Medium = "Radio"  
And Sales > 1400;

---

---

---

---

---

---

---

## Joining = Denormalizing

Join

II

## Where Do the Tables Come From

- We Have Been Assuming That We Have Tables to Normalize
  - What If We Don't Have Tables
  - Where Do We Start
- Answer: We Define Categories and Map Them Into Tables

## Summary

- Relational Table Design is Based on Functional Dependency
- 1<sup>st</sup> NF: All Data Items Must Be Atomic Facts
- 2<sup>nd</sup> NF: Full Functional Dependencies
- 3<sup>rd</sup> NF: No Transitive Dependencies
- Normalization Leads to Smaller Tables
- Joins Allow Us to Put Them Back Together Again
